## Answer on Question \#48207, Physics, Mechanics - Kinematics - Dynamics

An object placed on a scale is riding in an elevator. What is the measurement of mass taken by an observer in the elevator if the mass of the object at rest is 45.6 kg ? Assume that the acceleration of the elevator is directed upward and is equal to $2.72 \mathrm{~m} / \mathrm{s} 2$.

By the second Newton's law:

$$
N-m g=m a \rightarrow N=m(g+a)
$$

The measurement of mass will be:

$$
N=45.6 \mathrm{~kg} \cdot\left(9.81 \frac{\mathrm{~m}}{\mathrm{~s}^{2}}+2.72 \frac{\mathrm{~m}}{\mathrm{~s}^{2}}\right)=571 \mathrm{~N}
$$

Answer: $N=571 N$
