

Answer on Question 48524, Physics, Optics

Question:

Refraction is a measure of the as wave passes from medium to another.

Answer:

Refraction is a measure of the bending of a path of a wave as wave passes from one medium to another. We can measure how much wave is bent from Snell's law of refraction, $n_1 \sin \theta_i = n_2 \sin \theta_r$, where θ_i , θ_r are the angles of incidence and refraction, respectively and n_1 , n_2 are the refractive indices of first and second media.
