

Answer on Question #49471-Physics-Mechanics-Kinematics-Dynamics

A 20 kg block starts from rest at the top of a 60 degree incline and slides down the incline. There is a 0.1 coefficient of friction on the ramp. The block then continues to slide along the horizontal surface where there is a 0.3 coefficient of friction. The block then slows, due to friction, until it comes to rest at point B.

- (2) What is the magnitude of the force due to gravity (i.e. the weight) of the block on the incline?
- (2) What is the magnitude of the Normal Force on the block on the incline?
- (2) What is the magnitude of the frictional force on the block on the incline?
- (2) What is the magnitude of the acceleration of the block down the incline?
- (3) What is the velocity of the block at Point A?
- (3) What is the magnitude of the force of friction on the block on the horizontal?
- (3) What is the acceleration of the block along the horizontal?
- (3) What is the distance between Point A and Point B?

Solution

$$a.) w = mg = 20 \text{ kg} \cdot 9.8 \frac{\text{m}}{\text{s}^2} = 196 \text{ N}.$$

$$b.) \sum F_y = ma_y$$

$$F_N - mg \cos \theta = 0$$

$$F_N = mg \cos \theta = 196 \text{ N} \cos 60 = 98 \text{ N}.$$

$$c.) f = \mu F_N = 0.1 \cdot 98 \text{ N} = 9.8 \text{ N}.$$

$$d.) mg \sin \theta - f = ma$$

$$196 \text{ N} \sin 60 - 9.8 \text{ N} = 20 \text{ kg} \cdot a$$

$$a = 8.00 \frac{\text{m}}{\text{s}^2}.$$

$$e.) \sin \theta = \frac{h}{\Delta x}$$

$$\Delta x = \frac{h}{\sin \theta} = \frac{10 \text{ m}}{\sin 60} = 11.55 \text{ m}.$$

$$v^2 = v_0^2 + 2a\Delta x$$

$$|v| = \sqrt{2a\Delta x} = \sqrt{2 \cdot 8.00 \frac{m}{s^2} \cdot 11.55m} = 13.59 \frac{m}{s}.$$

$$f.) f = \mu mg = 0.3 \cdot 20 \text{ kg} \cdot 9.8 \frac{m}{s^2} = 58.8 \text{ N}$$

$$g.) a_x = -\frac{58.8N}{20kg} = -2.94 \frac{m}{s^2}.$$

$$h.) v^2 = v_0^2 + 2a_x\Delta x$$

$$\Delta x = \frac{v^2 - v_0^2}{2a_x} = \frac{0 - \left(13.59 \frac{m}{s}\right)^2}{2\left(-2.94 \frac{m}{s^2}\right)} = 31.41m.$$
