## Answer on Question 49668, Physics, Mechanics | Kinematics | Dynamics

## Question:

A pump with a power out put of 600 W raises water from a lake through a height of 3 m and delivers it with a velocity of $6 \mathrm{~m} / \mathrm{s}$. What mass of water is removed from the lake in one minute?

## Solution:

By the definition of power we have:

$$
P=\frac{W}{t}=\frac{m g h}{t} .
$$

From this formula we can obtain the mass of water removed from the lake in one minute:

$$
m=\frac{P t}{g h}=\frac{600 \mathrm{~W} \cdot 60 \mathrm{~s}}{9.8 \frac{\mathrm{~m}}{\mathrm{~s}^{2}} \cdot 3 \mathrm{~m}}=1224.5 \mathrm{~kg} .
$$

## Answer:

The mass of water removed from the lake in one minute is 1224.5 kg .
