

### Question 5177

A fizzy drink can bobs up and down in water due to waves travelling across the surface. The waves travel at 0.7ms<sup>-1</sup> and have a wavelength of 0.5m and an amplitude of 0.1m. Calculate the maximum velocity of the can?

#### Solution:

Lets write the equation for monochromatic wave, with given amplitude, frequency and wavelength:

$$y(x, t) = A \sin(kx + \omega t) = A \sin\left(\frac{2\pi}{\lambda} x + 2\pi \nu t\right) \quad (1)$$

We can find the  $v_y$ , by differentiating (1):

$$v_y = \frac{\partial y}{\partial t} = A \cdot 2\pi \nu \cdot \cos\left(\frac{2\pi}{\lambda} x + 2\pi \nu t\right) \quad (2)$$

Hence, the maximum  $v_y$  is

$$v_{y;max} = A \cdot 2\pi \nu \quad (3)$$

Also, we have a phase velocity for a monochromatic wave:

$$v_p = \frac{\omega}{k} = \lambda \cdot \nu \quad (4)$$

So, the maximum speed for the can is given by:

$$v_{max} = \sqrt{(v_{y;max}^2 + v_p^2)} = \nu \sqrt{(4\pi^2 A^2 + \lambda^2)} \quad (5)$$

Using numeric values given, and putting it into (5), we obtain:

$$v_{max} = 5.62 \cdot 10^{-4} \frac{m}{s}$$
