## Answer on Question \#51925-Physics-Field Theory

Average kinetic energy of molecules is
Inversely proportional to absolute temperature
Independent of absolute temperature

Directly proportional to absolute temperature
Directly proportional to square root of temperature

## Solution

Average kinetic energy of molecules in three dimensions is

$$
E=\frac{3}{2} k T
$$

So, average kinetic energy of molecules is directly proportional to absolute temperature.
Answer: Directly proportional to absolute temperature.

12 The specific heat of a gas in isothermal process is ?
0
Negative
constant

Infinite

## Solution

From the definition of heat capacity it follows that if the addition or removal of heat during an isothermal process does not lead to a change in system temperature, the heat capacity $c_{T}$ is infinitely large:

$$
c_{T}= \pm \infty
$$

(the plus sign corresponds to addition of heat to a system, the minus sign indicates the removal of heat from a system).

Answer: Infinite.

## 13 Latent heat of ice is ?

Less than external latent heat of fusion
Equal to external latent heat of fusion
More than external latent heat of fusion
Twice the external latent heat of fusion

## Solution

Latent heat of ice is more than external latent heat of fusion.

## Answer: More than external latent heat of fusion.

14 The r.m.s. velocity of the molecules in the sample of helium is $5 / 7$ th that of the molecules in the sample of hydrogen. If the temperature of the hydrogen sample is $0^{\circ} \mathrm{C}$ that of helium is
$0^{\circ} \mathrm{C}$
$0^{\circ} \mathrm{K}$
$273^{\circ} \mathrm{C}$
$100^{\circ} \mathrm{C}$

## Solution

The formula for r.m.s. velocity is

$$
v_{r m s}=\sqrt{\frac{3 R T}{M}}
$$

where $M$ is molar mass of gas, $T$ is temperature, $R$ is gas constant.

So,

$$
\frac{v_{r m s}\left(\mathrm{He}_{2}\right)}{v_{r m s}\left(\mathrm{H}_{2}\right)}=\sqrt{\frac{T\left(\mathrm{He}_{2}\right)}{T\left(\mathrm{H}_{2}\right)} \frac{M\left(\mathrm{H}_{2}\right)}{M\left(H e_{2}\right)}}
$$

Thus, the temperature of the helium is

$$
T\left(H e_{2}\right)=T\left(H_{2}\right)\left(\frac{v_{r m s}\left(H e_{2}\right)}{v_{r m s}\left(H_{2}\right)}\right)^{2} \frac{M\left(H e_{2}\right)}{M\left(H_{2}\right)}=(0+273) K\left(\frac{5}{7}\right)^{2} \frac{8}{2}=546 K=273^{\circ} \mathrm{C} .
$$

Answer: $\mathbf{2 7 3}^{\circ} \mathrm{C}$.

15 Mean square velocity of five molecules of velocities $2 \mathrm{~m} / \mathrm{s}, 3 \mathrm{~m} / \mathrm{s}, 4 \mathrm{~m} / \mathrm{s}, 5 \mathrm{~m} / \mathrm{s}$ and $6 \mathrm{~m} / \mathrm{s}$ is in $\mathrm{m} 2 / \mathrm{s} 2$ ?

10

18

20

15

## Solution

Mean square velocity of five molecules of velocities is

$$
\frac{2^{2}+3^{2}+4^{2}+5^{2}+6^{2}}{5}=18 \frac{\mathrm{~m}^{2}}{\mathrm{~s}^{2}}
$$

## Answer: 18.
