

Question #55091, Physics / Mechanics | Kinematics | Dynamics |

A truck starts from rest and accelerates at  $0.7\text{m/s}^2$ . 5 s later, a car accelerates from rest at the same starting point with an acceleration of  $2.2\text{m/s}^2$ .

a) Where and when does the car catch the truck?

56.47 m from the starting point

at 12.7 seconds from the moment the truck started to accelerate.

b) What are their velocities when they meet?

The truck :  $8.89\text{ m/s}$

The car :  $16.94\text{ m/s}$

**Answer:**

a) Let's make an assumption that they meet at the distance  $d$  from the starting point in  $t$  seconds:

Then,  $d = 0.5a_1t^2$ , where  $a_1$  – the acceleration of the truck, (for the truck) and

$d = 0.5a_2(t - \Delta t)^2 - 0.5a_1\Delta t^2$ , where  $a_2$  – the acceleration of the car and  $\Delta t$  – the difference in starting time (for the car).

Thus,

$$0.5a_1t^2 = 0.5a_2(t - \Delta t)^2 - 0.5a_1\Delta t^2,$$

$$0.5 \times 0.7t^2 = 0.5 \times 2.2(t - 5)^2 - 0.5 \times 0.7 \times 25$$

$$0.35t^2 = 1.1(t - 5)^2 - 8.75$$

$$0.35t^2 - 1.1(t^2 - 10t + 25) = -8.75$$

$$-0.75t^2 + 11t - 27.5 + 8.75 = 0$$

$$t^2 - 14.67t + 25 = 0$$

$$D = 215.21 - 100 = 115.21$$

$$t = [14.67 + 10.73]/2 = 12.7\text{ s}$$

The distance is:  $d = 0.5a_1t^2 = 0.5 \times 0.7 \times 12.7^2\text{ m} = 56.47\text{ m}$ .

b) The velocities are calculated by the equations:

For the truck:  $v = a_1t = 0.7 \times 12.7\text{ m/s} = 8.89\text{ m/s}$

For the car:  $v = a_2(t - \Delta t) = 2.2 \times (12.7 - 5)\text{ m/s} = 16.94\text{ m/s}$
