A model rocket rises with constant acceleration to a height of 3.3 m , at which this point its speed is $\mathbf{2 8 . 0}$ $\mathrm{m} / \mathrm{s}$. How much time does it take to reach this height?

Assuming that initial speed is 0 we can write an equation for body, which moving with constant acceleration:

$$
h=\frac{a t^{2}}{2}
$$

We know rocket speed at this height, so we can wind acceleration:

$$
\begin{gathered}
a=\frac{v}{t} \\
h=\frac{v t^{2}}{2 t}=\frac{v t}{2} \rightarrow t=\frac{2 h}{v} \\
t=\frac{2 * 3.3 m}{28 m / s} \cong 0.24 \mathrm{~s}
\end{gathered}
$$

Answer: $t \cong 0.24 s$
