

## Answer on Question 62184, Physics, Electromagnetism

### Question:

A horizontal, straight wire carrying  $12.0\text{ A}$  current from west to east is in the Earth's magnetic field  $B$ . At this place,  $B$  is parallel to the surface of the Earth, points to the north and its magnitude is  $0.04\text{ mT}$ . Determine the magnetic force on  $1.0\text{ m}$  length of the wire. If mass of this length of wire is  $50\text{ g}$ , calculate the value of current in the wire so that its weight is balanced by the magnetic force.

### Solution:

a) We can calculate the force exerted on the wire from the equation  $\mathbf{F}_B = I\mathbf{L} \times \mathbf{B}$ , where  $\mathbf{F}_B$  is the magnetic force,  $I$  is the current in the wire,  $\mathbf{L}$  is a vector that points in the direction of the current  $I$  and has a magnitude equal to the length  $L$  of the wire,  $\mathbf{B}$  is the magnetic field. Therefore, the magnitude of this force is:

$$F = ILB = 12.0\text{ A} \cdot 1.0\text{ m} \cdot 0.04 \cdot 10^{-3}\text{ T} = 4.8 \cdot 10^{-4}\text{ N}.$$

b) Because the weight of the wire is balanced by the magnetic force, we get:

$$F = W = mg,$$

$$ILB = mg.$$

From the last equation we can calculate the value of the current in the wire so that its weight is balanced by the magnetic force:

$$I = \frac{mg}{LB} = \frac{0.05\text{ kg} \cdot 9.8 \frac{\text{m}}{\text{s}^2}}{1.0\text{ m} \cdot 0.04 \cdot 10^{-3}\text{ T}} = 12250\text{ A}.$$

### Answer:

a)  $F = 4.8 \cdot 10^{-4}\text{ N}.$

b)  $I = 12250\text{ A}.$
