## Answer on question \#62528, Physics / Other

Question A jogger runs at a constant velocity of $4 \mathrm{~m} / \mathrm{s}$ for a time of 10 minutes. He then slows to a trot of $2 \mathrm{~m} / \mathrm{s}$ in the same direction for a time of 10 more minutes. He then jogs back toward his starting point, where his car is parked, at a rate of $4 \mathrm{~m} / \mathrm{s}$ without stopping. How far has the man jogged, and how long does it take him to return to his car ?

Solution $10 \mathrm{~min}=600 \mathrm{sec}$. Lets find total distance in one direction

$$
S=S_{1}+S_{2}=4 \cdot 600+2 \cdot 600=3600 \mathrm{~m}
$$

So he jogged on 3.6 km from his car. Time to get back is

$$
t=S / v=3600 / 4=900 \mathrm{~s}=15 \mathrm{~min}
$$
