## Answer on Question 62663, Physics, Other

## Question:

A cat chases a mouse across a 1.7 m high table. The mouse steps out of the way, and the cat slides off the table and strikes the floor 2.0 m from the edge of the table. What was the cat's speed when it slid off the table? The acceleration of gravity is $9.81 \mathrm{~m} / \mathrm{s}^{2}$. Answer in units of $m / s$.

## Solution:

Let's first find how long a cat fall from a high table from the formula:

$$
h=\frac{1}{2} g t^{2},
$$

here, $h$ is the height of the table, $g$ is the acceleration of gravity, $t$ is the time.
Then, from this formula we can calculate how long a cat fall from a high table:

$$
t=\sqrt{\frac{2 h}{g}}=\sqrt{\frac{2 \cdot 1.7 \mathrm{~m}}{9.81 \mathrm{~m} / \mathrm{s}^{2}}}=0.58 \mathrm{~s}
$$

As we know the time we can calculate the cat's speed when it slid off the table from the formula:

$$
d=v t
$$

here, $d$ is the horizontal distance that cat travel before it striking the floor, $v$ is the cat's speed when it slid off the table and $t$ is the time that cat takes to fall from a high table.

Then, from this formula we can calculate the cat's speed when it slid off the table:

$$
v=\frac{d}{t}=\frac{2.0 \mathrm{~m}}{0.58 \mathrm{~s}}=3.45 \frac{\mathrm{~m}}{\mathrm{~s}} .
$$

## Answer:

$v=3.45 \frac{\mathrm{~m}}{\mathrm{~s}}$.
