

## Answer on Question 64278, Physics, Mechanics, Relativity

### Question:

A proton moving with a speed of  $1.0 \cdot 10^7 \text{ m/s}$  passes through a  $0.020 \text{ cm}$  thick sheet of paper and emerges with a speed of  $2.0 \cdot 10^6 \text{ m/s}$ . Assuming uniform deceleration, find retardation and time taken to pass through the paper?

### Solution:

1) We can find the retardation of the proton from the kinematic equation:

$$v_f^2 = v_i^2 + 2as,$$

here,  $v_i$  is the initial speed of the proton,  $v_f$  is the final speed of the proton (after it passes through the sheet of paper),  $a$  is the retardation of the proton,  $s$  is the distance that proton passes when moving through the sheet of paper.

Then, we can find the retardation of the proton:

$$a = \frac{v_f^2 - v_i^2}{2s} = \frac{\left(2.0 \cdot 10^6 \frac{\text{m}}{\text{s}}\right)^2 - \left(1.0 \cdot 10^7 \frac{\text{m}}{\text{s}}\right)^2}{2 \cdot 2 \cdot 10^{-4} \text{ m}} = -2.4 \cdot 10^{17} \frac{\text{m}}{\text{s}^2}.$$

The sign minus indicates that the proton decelerates.

b) We can find the time taken to pass through the paper from another kinematic equation:

$$v_f = v_i + at,$$

$$t = \frac{v_f - v_i}{a} = \frac{2.0 \cdot 10^6 \frac{\text{m}}{\text{s}} - 1.0 \cdot 10^7 \frac{\text{m}}{\text{s}}}{-2.4 \cdot 10^{17} \frac{\text{m}}{\text{s}^2}} = 3.3 \cdot 10^{-11} \text{ s}.$$

### Answer:

a)  $a = -2.4 \cdot 10^{17} \frac{\text{m}}{\text{s}^2}.$

b)  $t = 3.3 \cdot 10^{-11} \text{ s}.$
