

Answer Question #65632 – Physics – Mechanics – Relativity

A simple harmonic motion is represented by $x(t) = a \cos \omega t$. Obtain expressions for velocity and acceleration of the oscillator. Also, plot the time variation of displacement, velocity and acceleration of the oscillator.

Solution. Consider the equation $x(t) = a \cos \omega t$, where a is the amplitude of the oscillation (maximum displacement), ω – the angular frequency, t – time.

The velocity of the object as a function of time is given by

$$v(t) = \frac{dx(t)}{dt} = a(-\sin \omega t)\omega = -a\omega \sin \omega t.$$

and the acceleration is given by

$$a(t) = \frac{dv(t)}{dt} = -a\omega(\cos \omega t)\omega = -a\omega^2 \cos \omega t.$$

Plot the time variation of displacement, velocity and acceleration of the oscillator.
