## Answer to Question \#68094, Physics / Mechanics | Relativity

## Question:

Five gas molecules chosen at random are found to have speeds of $500,600,700,800$ and 900 $\mathrm{m} / \mathrm{s}$. What is the rms speed? what is the average speed?

Answer:
The RMS speed (root mean square speed) is calculated as

$$
\bar{v}=\sqrt{\frac{\sum v_{i}^{2}}{n}}=\frac{\sqrt{\mathbf{5 0 0}^{2}+\mathbf{6 0 0}^{2}+\mathbf{7 0 0}^{2}+\mathbf{8 0 0}^{2}+\mathbf{9 0 0}^{2}}}{\sqrt{5}}=714.14 \frac{\mathrm{~m}}{\mathrm{~s}}
$$

The average speed is calculated as

$$
\frac{\sum v_{i}}{n}=\frac{500+600+700+800+900}{5}=700 \frac{\mathrm{~m}}{\mathrm{~s}}
$$
