## Answer on Question\#68705 - Physics - Electromagnetism

Distance between the two point charges +9 e and +e is 16 centimeter, where we can keep a third charge $q$ between them so that they will be in equilibrium?
Solution. Let's draw a sketch of the placement of charges

Let $x$-distance between charges $e$ and $q$. Hence distance between charges $9 e$ and $q$. Since the charges are in equilibrium, the resultant force acting on each of the charges is zero. Let us consider the forces acting on the charge $q$. The interaction of point charges is described by the Coulomb law

$$
F=\frac{k \cdot q_{1} \cdot q_{2}}{r^{2}}
$$

where $r$ - distance between charges $q_{1}$ and $q_{2}, k=8.99 \cdot 10^{9} \frac{{N m^{2}}_{C^{2}} \text {. }}{\text {. }}$
Therefore force between charges $e$ and $q$ equal to

$$
F_{1}=\frac{k \cdot e \cdot q}{x^{2}} .
$$

Therefore force between charges $e$ and $q$ equal to

$$
F_{2}=\frac{k \cdot 9 e \cdot q}{(16-x)^{2}} .
$$

As result $F_{1}=F_{2} \rightarrow \frac{k \cdot e \cdot q}{x^{2}}=\frac{k \cdot 9 e \cdot q}{(16-x)^{2}} \rightarrow \frac{1}{x^{2}}=\frac{9}{(16-x)^{2}} \rightarrow \frac{16-x}{x}=3 \rightarrow 16-x=3 x$.
$4 x=16 \rightarrow x=4 \mathrm{~cm}$.
Answer. For the charge to stay in equilibrium, it is necessary to place a charge of $q$ at a distance of 4 cm from the charge $e$.
