## Answer on Question \#72038- Physics-Other

Green light has a wavelength of 0.00000050 m , and a speed of $300000000 \mathrm{~m} / \mathrm{s}$

When the green light goes into glass, it slows down. Its new speed is $200000000 \mathrm{~m} / \mathrm{s}$. What is its frequency in glass?

## Solution

The frequency is constant, regardless of the medium:

$$
f_{g l a s s}=f_{a i r}=\frac{c_{a i r}}{\lambda_{\text {air }}}=\frac{300000000}{0.00000050}=6 \cdot 10^{14} \mathrm{~Hz}
$$

Answer: $6 \cdot \mathbf{1 0}^{\mathbf{1 4}} \mathbf{H z}$.
