## Answer on Question \#72201-Physics-Other

A $8000-\mathrm{N}$ car is traveling at $12 \mathrm{~m} / \mathrm{s}$ along a horizontal road when the brakes are applied. The car skids to a stop in 4.0 s . How much kinetic energy does the car lose in this time?

## Solution

The weight of a car is

$$
W=m g .
$$

The kinetic energy does the car lose in this time is

$$
\begin{gathered}
K=\frac{m v^{2}}{2}=\frac{W v^{2}}{2 g} \\
K=\frac{(8000) 12^{2}}{2(9.8)}=59 \mathrm{~kJ} .
\end{gathered}
$$

Answer: 59 kJ .
