

## Answer on Question 78046, Physics, Atomic and Nuclear Physics

### Question:

A juniper-wood plank measuring  $0.46 \text{ ft}$  by  $1 \text{ ft}$  by  $14 \text{ ft}$  is totally submerged in water.

- (a) What is its weight?
- (b) What is the buoyant force acting on it?
- (c) What is the size and the direction of the net force on it?

### Solution:

(a) By the definition, the weight density is the weight per unit volume:

$$D = \frac{W}{V},$$

here,  $D = 35 \text{ lb/ft}^3$  is the weight density of the juniper-wood plank [1],  $W$  is the weight of the juniper-wood plank and  $V$  is the volume of the juniper-wood plank.

Then, from this formula we can find the weight of the juniper-wood plank:

$$W = VD = 0.46 \text{ ft} \cdot 1 \text{ ft} \cdot 14 \text{ ft} \cdot 35 \frac{\text{lb}}{\text{ft}^3} = 225.4 \text{ lbs.}$$

(b) By the definition, the buoyant force is equal to the weight of the water displaced by the juniper-wood plank:

$$F_B = \rho_{\text{water}} V_{\text{plank}} g = D_{\text{water}} V_{\text{plank}},$$

here,  $F_B$  is the buoyant force,  $D_{\text{water}} = 62.4 \text{ lb/ft}^3$  is the weight density of the water [2] and  $V_{\text{plank}}$  is the volume of the juniper-wood plank.

Then, we can calculate the buoyant force:

$$F_B = D_{\text{water}} V_{\text{plank}} = 0.46 \text{ ft} \cdot 1 \text{ ft} \cdot 14 \text{ ft} \cdot 62.4 \frac{\text{lb}}{\text{ft}^3} = 402 \text{ lbs.}$$

(c) There are two forces acting on the juniper-wood plank when it totally submerged into the water: the weight of the juniper-wood plank directed downward and the buoyant force directed upward. Let's assume the upwards as a positive direction. Then, we can find the size of the net force:

$$F_{\text{net}} = F_B - W = 402 \text{ lbs} - 225.4 \text{ lbs} = 176.6 \text{ lbs.}$$

The sign plus indicates that the net force directed upward.

### Answer:

(a)  $W = 225.4 \text{ lbs}$ .

(b)  $F_B = 402 \text{ lbs}$ .

(c)  $F_{net} = 176.6 \text{ lbs}$ , upward.
