

## Answer on Question 78088, Physics, Astronomy, Astrophysics

### Question:

A body has a weight  $90 \text{ kg}$  on the surface of the Earth, the mass of the Moon is  $1/9$  that of Earth's mass and its radius is  $1/2$  that of the Earth's radius. On the Moon the weight of the body is?

### Solution:

As we know, the acceleration due to gravity on the surface of the Earth is given by the formula:

$$g_E = \frac{GM_E}{R_E^2},$$

here,  $G$  is the universal gravitational constant,  $M_E$  is the mass of the Earth,  $R_E$  is the radius of the Earth.

Then, from the definition of the weight, we can find the weight of the body on the Earth:

$$W_E = m \frac{GM_E}{R_E^2} = mg_E, (1)$$

here,  $m$  is the mass of the body.

Also, we know from the condition of the question that  $M_M = \frac{1}{9}M_E$ ,  $R_M = \frac{1}{2}R_E$ .

Then, the acceleration due to gravity on the surface of the Moon will be:

$$g_M = \frac{G \frac{1}{9}M}{\left(\frac{1}{2}R\right)^2} = \frac{4}{9} \frac{GM}{R^2} = \frac{4}{9}g_E.$$

Then, the weight of the body on the Moon:

$$W_M = m \frac{4}{9}g_E (2).$$

Let's divide equation (2) by equation (1), we get:

$$\frac{W_M}{W_E} = \frac{m \frac{4}{9}g_E}{mg_E} = \frac{4}{9}.$$

Then, we can find the weight of the body on the Moon:

$$W_M = \frac{4}{9} \cdot W_E = \frac{4}{9} \cdot 90 \text{ kg} = 40 \text{ kg}.$$

**Answer:**

$$W_M = 40 \text{ kg}.$$
