

## Answer on Question #79364 - Physics - Molecular Physics / Thermodynamics

**Question:** Two litres of hydrogen at a pressure of  $10^5$  Pa expands adiabatically to 1.5 times the initial volume. Find the work done?

**Answer:**

The first law of thermodynamics [1] can be formulated in the following way:

$$Q = \Delta U + A, \quad (1)$$

where  $Q$  is amount of heat supplied to the system,  $\Delta U$  is the change in the internal energy of the system,  $A$  is the work done by the system. For adiabatic process  $Q = 0$ , so that the work can be done due to the loss of the internal energy only:

$$A = -\Delta U. \quad (2)$$

Hydrogen is a diatomic (ideal) gas, and each of its molecules possesses  $i = 5$  degrees of freedom. Hence, the change in its internal energy should be written as:

$$\Delta U = \frac{5}{2} \nu R (T_2 - T_1). \quad (3)$$

According to Mendeleev-Clapeyron equation

$$\begin{aligned} p_1 V_1 &= \nu R T_1, \\ p_2 V_2 &= \nu R T_2, \end{aligned} \quad (4)$$

Hence,

$$\nu R (T_2 - T_1) = p_2 V_2 - p_1 V_1. \quad (5)$$

There is also one more useful relation for the adiabatic processes:

$$p V^\gamma = \text{Const}, \quad (6)$$

where  $\gamma$  is the adiabatic index (= heat capacity ratio). For diatomic ideal gases  $\gamma = \frac{7}{5}$  (see [2] for details).

As a result, one can show that:

$$p_2 = p_1 \left( \frac{V_1}{V_2} \right)^\gamma. \quad (7)$$

Combining (2)-(3), (5), (7) together and taking into account the relation  $V_2 = 1.5 V_1 = \frac{3}{2} V_1$ ,

we deduce

$$A = -\frac{5}{2}(p_2V_2 - p_1V_1) = \frac{5}{2}p_1V_1 \left[ 1 - \left( \frac{V_1}{V_2} \right)^{\gamma-1} \right] = \frac{5}{2}p_1V_1 \left[ 1 - \left( \frac{2}{3} \right)^{2/5} \right]. \quad (8)$$

Substituting the numerical values, we obtain:

$$A \approx \frac{5}{2} \cdot 10^5 \cdot 2 \cdot 10^{-3} (1 - 0.85) = 425 \text{ J}. \quad (9)$$
