Answer on Question \#83474-physics - thermodynamics

1. At what temperature the root mean square velocity will be half of that standard pressure and temperature, the pressure being kept constant.

## Solution.

Calculate the root mean square velocity by relation as follows.

$$
V_{r m s}=\sqrt{\frac{3 R T}{M}}
$$

Here, $R$ is the gas constant , $T$ is the standard temperature and $M$ is the mass of mole.
Here , $V_{r m s}$ is directly propotional to the square root of temperature.

$$
V_{r m s} \propto \sqrt{T}
$$

Substitute 273 K for T.
Calculate the temperature at half root mean square velocity by the relation as follows.

$$
V_{r m s}{ }^{\prime} \propto \sqrt{T}^{\prime}
$$

Here , $V_{r m s}{ }^{\prime}$ half mean square velocity.
By the proportionality relation

$$
\begin{aligned}
\frac{V_{r m s}}{V_{r m s}{ }^{\prime}} & =\sqrt{\frac{273 K}{T^{\prime}}} \\
2 & =\sqrt{\frac{273 K}{T^{\prime}}} \\
T^{\prime} & =\frac{273 K}{4} \\
T^{\prime} & =68.25 \mathrm{~K}
\end{aligned}
$$

Answer : 68.25 K
2. For an ideal gas $=1.4$, calculate the values of molar specific heats of the gas .( $\mathrm{R}=8.31 \mathrm{~J} / \mathrm{mol} \mathrm{K}$ )

## Solution.

Calculate the molar specific heats by the relation as follows.

$$
\begin{aligned}
\gamma & =\frac{C_{P}}{C_{V}} \\
C_{P} & =\gamma C_{V}
\end{aligned}
$$

Here, $C_{P}$ is the molar specific heat at the constant pressure and $C_{V}$ is the molar specific heat at constant volume.

Calculate the values of molar specific heats by the relation as follows.

$$
\begin{gathered}
C_{P}-C_{V}=R \\
\gamma C_{V}-C_{V}=R
\end{gathered}
$$

Substitute $\gamma=1.4$ and $\mathrm{R}=8.31 \mathrm{~J} / \mathrm{mol} \mathrm{K}$.

$$
\begin{gathered}
1.4 C_{V}-C_{V}=8.31 \\
C_{V}=\frac{8.31 \mathrm{~J} / \mathrm{molK}}{0.4} \\
C_{V}=20.775 \mathrm{~J} / \mathrm{molK}
\end{gathered}
$$

Calculate $C_{P}$ by the relation

$$
\begin{gathered}
C_{P}=\gamma C_{V} \\
C_{P}=(1.4)\left(20.775 \frac{\mathrm{~J}}{\mathrm{molK}}\right) \\
C_{P}=29.085 \mathrm{~J} / \mathrm{molK}
\end{gathered}
$$

## Answer.

$$
C_{V}=20.775 \mathrm{~J} / \mathrm{molK}
$$

$$
C_{P}=29.085 \frac{\mathrm{~J}}{\mathrm{~mol}} K
$$

3. How much heat is required to raise the temperature by 40 of 14 g nitrogen gas at constant pressure?[Molar mass of nitrogen=28 g, $\mathrm{R}=8.31 \mathrm{~J} / \mathrm{Kmol}$ for diatomic gas $=5 / 2 R$ ]

## Solution.

Calculate the heat required by the relation as follows.

$$
Q=n C_{V} \Delta T
$$

Here, n is the mole of gas, $C_{V}$ is the molar specific heat of gas and $\Delta T$ is the temperature difference.

$$
\begin{aligned}
& Q=(14 / 28)(5 \mathrm{R} / 2)(40) \\
& Q=(0.5)\left(2.5 \times 8.31 \frac{\mathrm{~J}}{\mathrm{~mol}} K\right)(40 \mathrm{~K}) \\
& Q=415.7 \mathrm{~J}
\end{aligned}
$$

Answer. 415.7 J
4. In Young's experiment separation between two slits is $3.5 \times 10^{-4} \mathrm{~m}$ and the distance of the
screen from the plane of the slit is .73 m . What is the distance from the central bright
point to the first bright point in the screen? $\left[\lambda=550 \times 10^{-10} \mathrm{~m}\right]$

## Solution.

Calculate the distance of first bright point from the central bright point by the relation as follows.

$$
x=\left(\frac{D}{d}\right) n \lambda
$$

Substitute 0.73 m for D and $3.5 \times 10-4 \mathrm{~m}$ for d and $550 \times 10-10 \mathrm{~m}$ for $\lambda$ and 1 for n .

$$
\begin{gathered}
x=\left(\frac{0.73 \mathrm{~m}}{3.5 \times 10^{-4} \mathrm{~m}}\right)(1)\left(550 \times 10^{-10} \mathrm{~m}\right) \\
x=114.71 \times 10^{-6} \mathrm{~m}
\end{gathered}
$$

Answer. $114.71 \times 10^{-6} \mathrm{~m}$
5.The phase difference between two points in a wave is $\pi / 2$. What is the path difference
between those two points?
Solution.
Calculate the path difference by the relation as follows.

$$
\Delta X=\frac{\lambda \cdot \Delta \phi}{2 \pi}
$$

Here, $\lambda$ is the wavelength, $\Delta \phi$ is the phase difference.
Substitute $\frac{\pi}{2}$ for phase difference.

$$
\begin{gathered}
\Delta X=\frac{\lambda \cdot\left(\frac{\pi}{2}\right)}{2 \pi} \\
\Delta X=\frac{\lambda}{4}
\end{gathered}
$$

Answer. $\frac{\lambda}{4}$
