

Answer on Question#39504- Programming, C++

1. Write C++ program in which the main()function uses several cout statements to display a memo to your boss. Use the company name "C++ Software Developers" at least three times in the memo. Each time you want to display the company name, instead of using a cout statement, call a function named companyName()that displays the name.

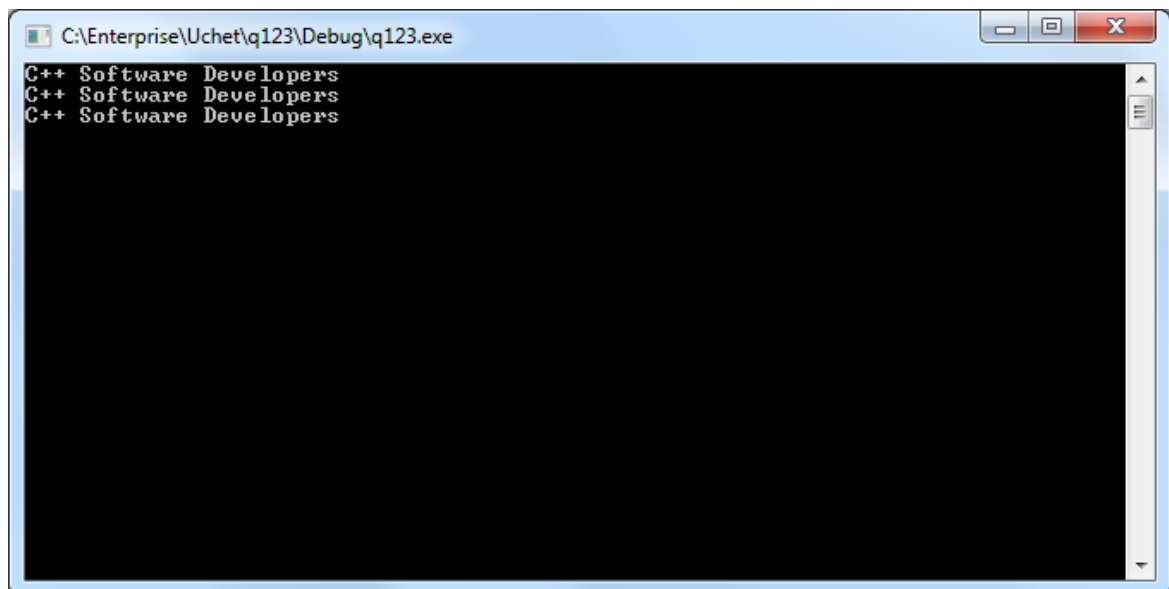

Solution.

```
#include <iostream>

using namespace std;
char* companyName();
int main(int argc, char* argv[])
{
    cout<<companyName()<<endl;
    cout<<companyName()<<endl;
    cout<<companyName()<<endl;

    cin.get();
    return 0;
}

char* companyName()
{
    char* ch="C++ Software Developers";
    return ch;
}
```

```
C:\Enterprise\Uchet\q123\Debug\q123.exe
C++ Software Developers
C++ Software Developers
C++ Software Developers
```
