Answer on Question #37771 – Programming - Java

B. The square brackets should be empty

An array declaration has two components: the array's type and the array's name. An array's type is written as type[], where type is the data type of the contained elements; the brackets are special symbols indicating that this variable holds an array. The size of the array is not part of its type (which is why **the brackets are empty**).
