Answer on Question #45147, Programming, C++

Problem.

Hello experts...

Am coding a mathematical tutoring game as my end of year project

Question.. Chapter 3 in the project report requires a literature review Need help writing a literature review

Solution.

In the literature preview you may write about mathematical literature that you used to create your project and how you use results from this literature in your project. If you created some new training methods, then you may compare them with methods that are discussed in some books, give advantages and disadvantages. You should divide your review into three parts:

- introduction;
- body;
- conclusion.

The introduction should include short information about mathematical tutoring games, your program and literature that you have selected.

The body should include historical background, methods that use to create your project and literature about them, advantages and disadvantages of your program.

The conclusion should include a summary of work that you have made.
